

SOUNDBRIDGE

Navigating SoundBridge

A walkthrough of every screen in the workspace, in the order you meet them.

Audience

Anyone using the SoundBridge workspace

Routes

Written as typed after your SoundBridge address

Updated

19 September 2026

1. Getting in

/ — Landing

The public entry page. It links to sign-up and sign-in. Signed in and past onboarding, you land on `/portal` instead.

/signup — Create an account

You accept the versioned terms and privacy documents here (readable at `/legal/terms` and `/legal/privacy`). Sign-in lives on the same screen.

Forgot a password? `/password-reset` sends a recovery link through the configured mail backend.

/verify-email — The first gate

Until your email is verified, the workspace is closed to you. You can reach only sign-out, onboarding, `/settings`, public profiles and the legal pages; everything else redirects back here, and the JSON API answers `403 email_unverified`.

Locally the verification message sits in a durable outbox rather than being sent. Flush it and read the link from your terminal:

```
python manage.py deliver_email
```

2. Onboarding — the second gate

Onboarding is persistent: `/portal` bounces you to the next incomplete step until every required one is done. The steps are ordered, and **which steps you get depends on the goals you pick**:

Order	Route	What it asks	Required
1	<code>/onboarding</code>	Your role	Always
2	<code>/goals</code>	What you want from the platform	Always — pick at least one
3	<code>/profile-setup</code>	Name, username, country/region, biography	Always — all four
4	<code>/genres</code>	Genres and skills	Always — at least one genre or skill
5	<code>/royalty-setup</code>	Royalty starting point	Only if you chose "Understand royalties"
6	<code>/release-setup</code>	First release plan	Only if you chose "Plan a release"

If you want to see the royalty and release setup steps, choose those two goals at step 2. Each step refuses to advance until its fields are filled — the error tells you exactly which. Once the last required step is done you are dropped at `/portal` and onboarding never reappears.

3. The workspace shell

Every signed-in page shares one frame:

- **Left sidebar** — eleven links in two captioned groups: *Your network* (Overview, Discover, Collaborations, Connections, Notifications, Opportunities) and *Your creative toolkit* (AI Team, Royalties, Release Planner, Analytics, Music Search). On a narrow screen it collapses behind the hamburger button.
- **Top bar** — the current page name, and a **"Find your next move"** search button. That opens a jump-to dialog covering the sidebar pages plus four that are not in the sidebar: Royalty Calculator, Statement Upload, Membership, and Settings & profile. This is the fastest way to reach anything.

Screens not in the sidebar or the search dialog are reached from within a page: a collaboration workspace from `/collaborations`, a release from `/release-planner`, an import review from `/royalty-upload`, and so on.

4. Your network

`/portal` — Overview

The home screen. Four stat tiles, each a link: profile completeness (→ `/settings`), saved creators (→ `/collaborations`), release plans (→ `/release-planner`), AI conversations (→ `/assistants`). Below them your most recent release plan with its task readiness percentage and next three unfinished tasks, plus three suggested next moves.

`/discover` — Find people

Lists published profiles of verified, active accounts. Filter by search text and role using the controls (they are URL parameters, so a filtered view is bookmarkable). Sample seeded creators appear under their own legacy cards at `/creators/<id>` and can be saved for later; they are demonstration records, not real accounts.

Open anyone's public page at `/people/<username>`.

`/connections` — Requests, blocks and reports

Send a request from someone's profile; accept, decline or withdraw from here. Blocking is available per person, and `/reports/new` files a report for moderator review. Connection requests are rate-limited per day by your plan (`connection_requests_daily`).

[/messages/<connection id>](#) — Direct threads

A one-to-one thread, reachable from an accepted connection. You cannot message someone you are not connected to.

[/collaborations](#) — Projects

Create a project with a brief, then open it to get its own workspace, which holds:

- **Brief** — title, description, state, start and end dates. Owner-only. Marking it *completed* closes the project.
- **Participants** — invite by username (published, verified accounts only). Invitations expire after 7 days; the invited person accepts at [/collaborations/invitations](#). Owners can remove access.
- **Milestones** — title, due date, optional assignee. The owner or the assignee can move a milestone's state and leave notes.
- **Messages** — a group thread, paginated 30 at a time, rate-limited to 30 sends. Any message can be reported.
- **Files** — PDF, text, image or audio, up to 5 MB each, 100 per project. **Every upload is quarantined until scanned**, so without a malware scanner configured the download link never appears. This is the expected behaviour on a plain local setup.
- **Split proposals** — propose percentage shares across the accepted parties; each party responds. Rounds are versioned, so the history of who proposed what is kept.
- **Activity** — the last 50 audit events for the project.
- **Mute** — silences notifications for this project only.

[/notifications](#)

Everything that happened to you: invitations, connection requests, milestone changes. Mark items read here, and set your per-category preferences.

[/opportunities](#)

Operator-reviewed listings only — unverified and sample rows never appear, and anything past its deadline drops out. Filter by type, region, or saved-only. Per listing you can save it, keep a private application draft (at least 20 characters), mark it *applied* or *withdrawn* to track your own status, or report it.

Applications are completed on the external site. Saving a draft or opening the link does not submit anything on your behalf.

5. Your creative toolkit

[/assistants](#) — AI Team

Thirteen specialists across three categories:

Category	Specialists
Business	Artist Manager, Royalty Assistant, Legal Information Assistant, Release Planner, Strategy Assistant, Collaboration Matcher, Profile Manager
Creative	A&R Advisor, Production Coach, Songwriting Partner
Growth	Content Strategist, Music Publicist, Live & Booking Coach

Three guided workflows chain them: *Take a release from idea to launch*, *Develop a song*, *Understand my music business*.

How a session goes: pick a specialist (or a workflow), use a suggested starter or type your own, and converse. From a reply you can **save it to your work library** (downloadable at `/assistants/work/<id>.txt`), **hand off** the brief and latest reply to another specialist, or leave feedback on it. Your **artist brief** is shared context every specialist reads; edit it once and they all see it.

Control what they may read at `/assistants/context` — context sharing is explicit, not assumed. Delete a whole conversation from the same screen.

Two limits to expect: a per-account allowance of 30 AI requests per UTC day (`SOUNDBRIDGE_AI_DAILY_LIMIT`), and your plan's `ai_daily` capability. Without `OPENAI_API_KEY` set, the screen loads but requests fail — the status indicator only reports that a key is present, not that it works.

`/royalties` — Overview

Currency-aware earnings totals from your imported statements, plus your saved calculations. The entry point to the four screens below.

`/royalty-calculator`

Enter your assumptions and get low / mid / high scenarios computed with decimal arithmetic. Save a scenario (`/royalties/calculations/<id>` to revisit or edit). Assumptions are stored alongside the numbers, so a saved scenario always explains itself. This is educational modelling, not a forecast.

`/royalty-upload` — Statement import

The most multi-step flow in the app:

1. **Upload** a CSV. `/royalty-upload/sample` downloads a sample file showing the expected shape.
2. The file is **quarantined** and queued for scanning. Run `python manage.py scan_files` then `python manage.py process_statements` locally, or let Celery do it in the Docker stack. **Without a configured scanner the batch stays quarantined and never reaches review** — expected on a plain Windows setup.
3. **Review** at `/royalties/imports/<batch id>`: map each of your CSV's columns to a field, name the source, set the period. A preview of up to 50 rows shows what the mapping produces before you commit.
4. **Confirm** — income totals update. You can re-map and confirm again if you got it wrong.
5. **Export** a statement back to CSV at `/royalties/statements/<id>/export`, or delete a batch outright.

[/royalties/income](#) , [/royalties/summary](#) , [/royalties/education](#)

Manual income entry for money that never came through a statement; grouped, currency-aware reporting by source and period; and plain-language explanations of how music rights and royalties work.

[/release-planner](#)

Create release plans, then open one at [/releases/<id>](#) to edit its stage, campaign notes and metadata readiness, and to manage dated tasks. Ticking tasks drives the readiness percentage shown on [/portal](#) and [/analytics](#) .

[/analytics](#)

Four counts — saved creators, completed collaborations, completed release tasks, imported statements — plus per-release task completion bars and earnings totals by currency. It reports on your own data; there is no streaming or platform analytics connection.

[/music-search](#)

Public Spotify catalog search. Choose a market and search. Needs [SPOTIFY_CLIENT_ID](#) and [SPOTIFY_CLIENT_SECRET](#) .

This is catalog search only. It is **not** a Spotify account connection — no playlists, listening history or Spotify for Artists data, because that needs a user-consent flow that is not implemented.

6. Account, privacy and plan

[/settings](#) — **Settings & profile**

Your account basics, and [/settings/export](#) downloads your workspace as JSON.

[/settings/professional](#) — **Public profile**

The profile other people actually see. Publish it, control field-by-field visibility, and add sourced credits and portfolio links. Profile completeness here is the percentage shown on [/portal](#) . Your public page is [/people/<username>](#) .

[/settings/privacy](#)

Password-confirmed actions: revoke AI context permissions, request a **data export** (served as JSON, then available under your artifacts), or request **account deletion**.

Deletion and export requests are carried out by [python manage.py process_privacy_requests](#) , and **only once a retention policy has been approved in the admin**. With no approved policy nothing is processed — deliberate, not a bug.

[/membership](#)

Your current plan and its capability limits: `ai_daily` , `release_plans` , `active_collaborations` , `saved_calculations` , `statements` , `connection_requests_daily` . A `402` anywhere in the app means you hit one of these.

Checkout refuses to act until `SOUNDBRIDGE_BILLING_PROVIDER` names an implemented adapter — it will not simulate a charge. Downgrading never deletes anything; you keep your data and simply cannot add more.

[/admin/](#)

Django admin, for the account you made with `createsuperuser` . Staff status alone grants no permissions — assign explicit group permissions. Operators use it to verify opportunity listings, handle reports, and approve the retention policy and plans. Keep moderation, commercial approval and account administration in separate roles.

7. Things that will look broken but aren't

What you see	Why
Redirected to <code>/verify-email</code> from everywhere	Email not verified. Run <code>deliver_email</code> .
Redirected back into onboarding from <code>/portal</code>	A required step is incomplete.
Uploaded file or CSV stuck, no download link	No malware scanner. Quarantine is fail-closed by design.
Statement never reaches review	Run <code>scan_files</code> and <code>process_statements</code> , or use the Docker stack.
Logged out when moving between pages	You switched between <code>localhost</code> and <code>127.0.0.1</code> ; they hold separate cookies.
No verification or notification email	The console backend queues it — run <code>deliver_email</code> and read your terminal.
<code>402</code> on an action	A plan limit. See <code>/membership</code> .
Checkout does nothing	No billing adapter configured. It refuses rather than fake a charge.
Privacy export or deletion never completes	No approved retention policy in the admin.
Royalty setup and release setup never appeared	You didn't choose those two goals during onboarding.
